

Title: AI TAILOR ECOSYSTEM

AI-Powered Smart Tailoring & Personalized Fashion Platform

Tagline: Your Style. Your Fit. Always Personalized.

Mentee Name: Ratikanta Nayak, Deepak Kumar Sahoo, Soumya Ranjan Behera

Mentor Name: Manish Chandra Roy

Course: BCA, Ravenshaw University

1. PROBLEM

- Customers buying clothes online often face **overfitting, underfitting, fabric-quality issues, and colour/design mismatch**.
- Traditional tailoring depends heavily on **manual measurements**, causing measurement errors, poor fitting, and repeated alterations.
- Customers often struggle to find a **trusted tailor, suitable fabric, design, colour, and personalized fitting** in one place.
- Local tailors face **limited customer reach, manual order management, and unpredictable customer demand**, making business planning difficult.
- Fabric manufacturers face **unpredictable demand, inventory mismatch, overstocking or shortages, and inefficient supply planning**.

2. UNIQUENESS OF THE PROBLEM

- We address the **complete clothing journey**, from body measurement and fabric selection to custom manufacturing and delivery.
- Unlike ordinary online clothing platforms, our model focuses on **custom-manufacturing garments according to individual measurements and preferences**.
- AI combines **body measurements, style preferences, fabric, colour, and design choices** to create personalized garment specifications.
- The platform connects **Customer + AI + Tailor + Fabric Manufacturer**, while using demand information to support better production planning.

- Customer and order data can help identify **changing preferences and demand patterns**, improving future personalization and supply planning.

3. SOLUTION SUGGESTED

- Create an **AI-powered digital body profile** to generate personalized garment measurements and reduce fitting errors.
- Allow customers to select and personalize **fabric, colour, design, fitting, collar, sleeve, and other garment specifications**.
- Enable **custom manufacturing** through our connected network of verified tailors and manufacturing partners instead of simply selling ready-made clothing.
- Provide tailors with **digital customer profiles, order management, demand visibility, and structured garment specifications**.
- Use aggregated order and preference information to help fabric manufacturers **plan production and inventory according to customer demand**.

4. METHODOLOGY

- **Step 1 — Customer Profile:** Customer creates an AI-assisted body profile and provides style and fitting preferences.
- **Step 2 — Personalization:** AI recommends suitable **fit, fabric, colour, design, and occasion-based options**.
- **Step 3 — Order & Demand Data:** Customer places a customized order; the platform records order requirements and demand patterns.
- **Step 4 — Custom Manufacturing:** Specifications are shared with the connected tailor/manufacturer for **production, quality checking, and delivery**.
- **Step 5 — Continuous Improvement:** Measurements, feedback, alterations, order history, and demand patterns are used to **improve future personalization and supply planning**.

5. FEASIBILITY

- The model is **asset-light**, using existing local tailors and fabric manufacturers instead of requiring our own factories initially.

- The pilot can start with a **small number of customers, tailors, and fabric partners** to validate the complete process.
- Revenue can come from **platform fees, tailor commissions, premium customization, subscriptions, featured listings, and alteration services**.
- Existing technologies such as **AI, computer vision, databases, mobile/web applications, and cloud services** can support the platform.
- The business can be validated **city-by-city**, allowing demand, operating costs, and customer acceptance to be measured before expansion.

6. SCALABILITY

- The platform can expand from **local tailoring networks to multiple cities and eventually nationwide markets**.
- The digital Fit Passport allows customers to **update measurements and preferences** whenever their body or style changes.
- Increasing customer orders generate valuable **demand patterns**, helping attract more tailors and manufacturers and improve supply planning.
- Future technologies such as **AR/VR try-on, GenAI design generation, predictive wardrobe recommendations, and demand forecasting** can be integrated.
- The asset-light ecosystem can scale without requiring the company to build **physical manufacturing facilities in every city**.

7. SOCIETAL IMPACT

- Reduces problems related to **poor fitting, repeated alterations, unsuitable online purchases, and unnecessary returns**.
- Gives local tailors **digital tools, wider customer reach, and better visibility of customer demand**.
- Helps traditional tailoring businesses participate in the **digital economy while preserving their skilled work**.
- Better demand forecasting can help reduce **overproduction, unnecessary inventory, material waste, and supply inefficiency**.
- Creates a connected fashion ecosystem benefiting **customers, tailors, fabric manufacturers, and the wider clothing industry**.
